INTRODUCTION

- In Sri Lanka ,  [3]
- Every 3 hours, A person dies in Road Accident.
- Every 3 days, a Child dies in Road Accident.
- Population : Mobile Phone ratio is 1.4 per person [4]

INTRODUCTION

WHY WE CHOOSE THIS TOPIC

?

- So many railway-crossing collisions happen in Sri Lanka annually.
- These railway-crossing collisions cost many loss of lives and property damages annually.

[1]

Polaahawela level crossing accident was a collision between a bus travelling from Galkiriyadda to Colombo and a train at a level crossing in Yangalmodara, near Polgahawela in Kurunegala district on 27 April 2005 at 8.30 local time, which resulted in the **death of 41 people**

[2]

INTRODUCTION

- Citizens have to face collisions at the railway-crossings due to many reasons, unfortunately.
 1. **Unsafety Railway Crossings** – Many unsafety railway crossings all around Sri Lanka.
 2. **Poor Visibility** – This can happen due to heavy rain, and fog conditions.
 3. **Human Errors** – Citizens may misjudge the speed or distance of an approaching train, leading to accidents or near-misses.
 4. **Lack of Awareness** – Citizens may not be aware of the dangers posed by railway crossings or the proper safety procedures to follow when crossing tracks.

INTRODUCTION

A technology-based solution called the Train Tracking and Detection System for Citizens via the Sim or a Tracker enables people to follow the movement and location of trains in real time. Both a separate tracker device and a mobile phone with a sim card can be used to access this system. For the most recent information on the whereabouts and status of trains, the system makes use of GPS and other real-time data sources. Passengers can make better travel plans with this information, decreasing the likelihood of missing trains or having a long wait. In order to increase the general effectiveness and safety of railway operations, train operators can also utilize this technology to monitor the performance of their trains.

OBJECTIVE

MAIN OBJECTIVE

PROVIDE AN IT-BASED SOLUTION TO ADDRESS THE SAFETY OF THE CITIZEN IN SRI LANKA FROM THE RAILWAY – CROSSINGS COLLISIONS

SUB OBJECTIVE

- Develop an User-friendly application that provide real-time data of trains and send alerts to the user properly.
- Gather and analyze data to train models.
- Provide the security and the privacy to the application as appropriate.
- To evaluate the effectiveness and reliability of the developed system through testing and validation.

METHODOLOGY

1. Data Collecting

02. Model Building

03. Model Testing

04. UI Designing

05. Security Designing

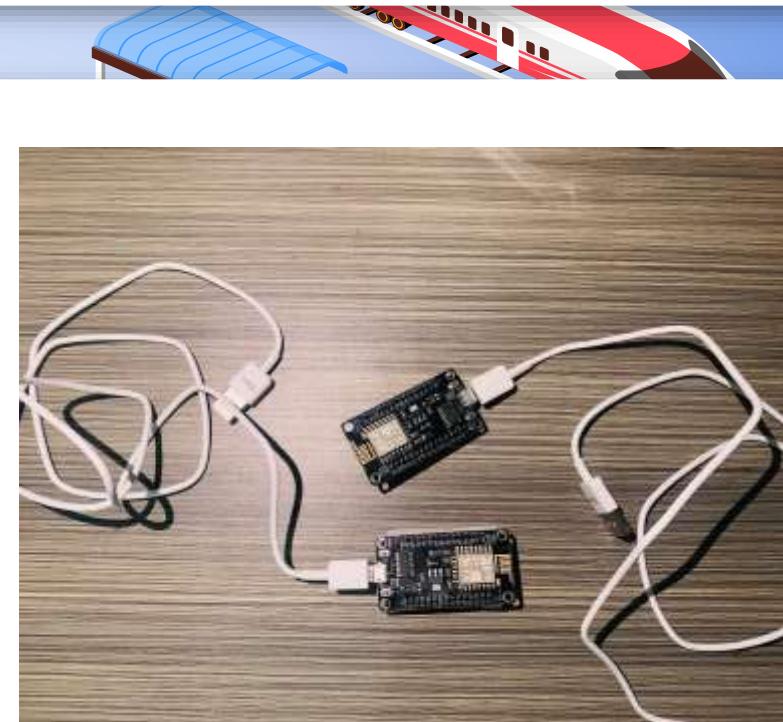

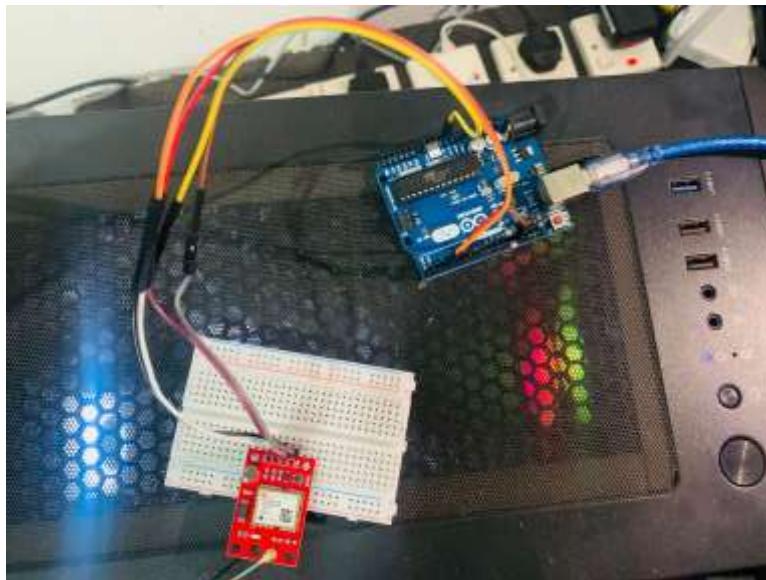

06. Security Testing

07. Integrating

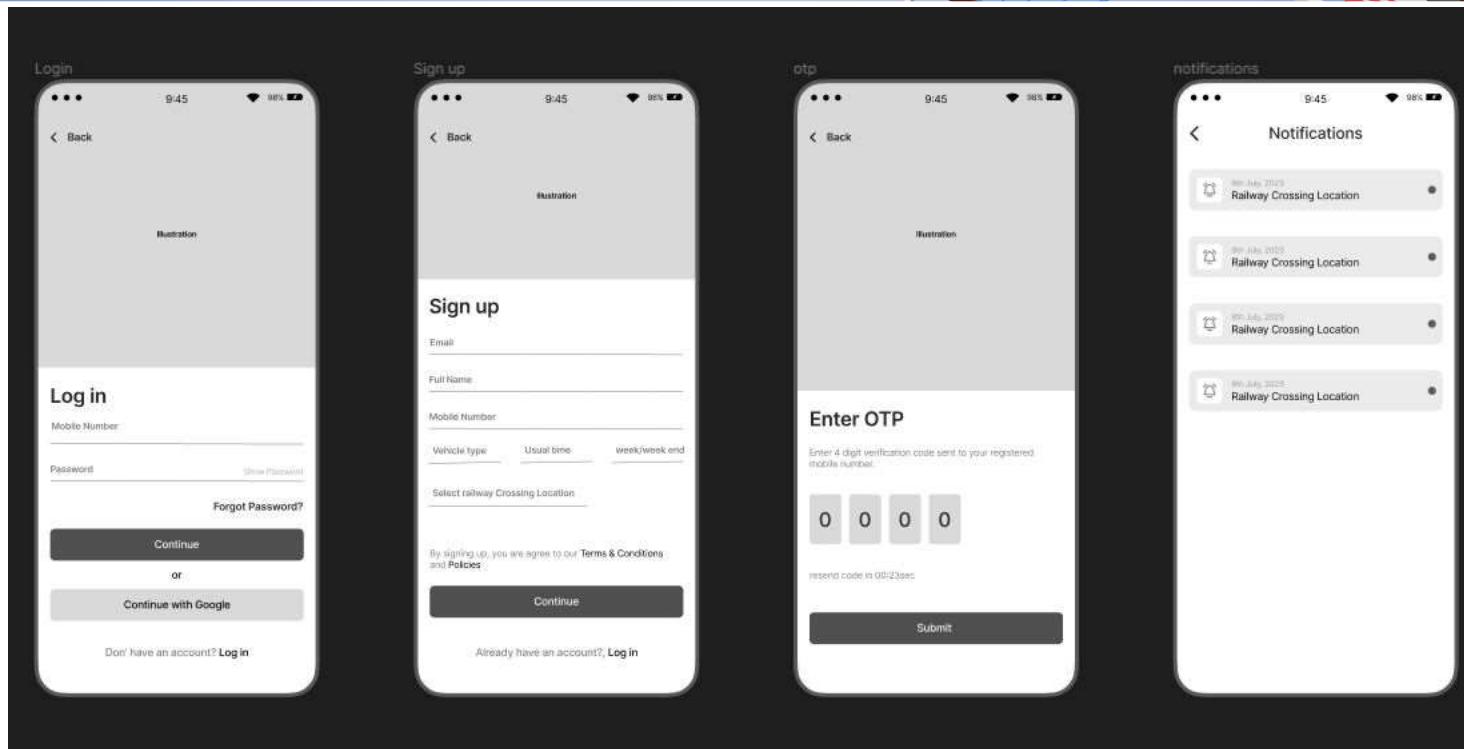

08. Testing

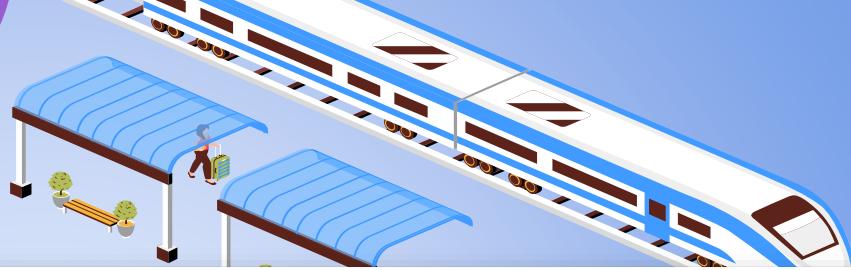

09. Deployment of the Prototype

USED DEVICES

WIREFRAMES for MOBILE APPLICATION

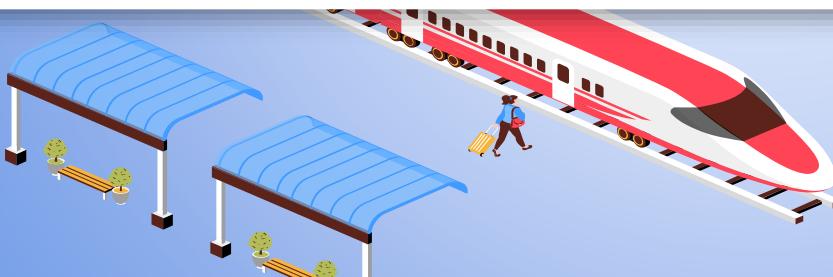

To develop a system that utilizes
GSM trackers on trains and IoT
devices at railway crossings to
predict and alert potential blind
spots on the train.

Biyanwila B.D.V.J
IT20212490
Data Science

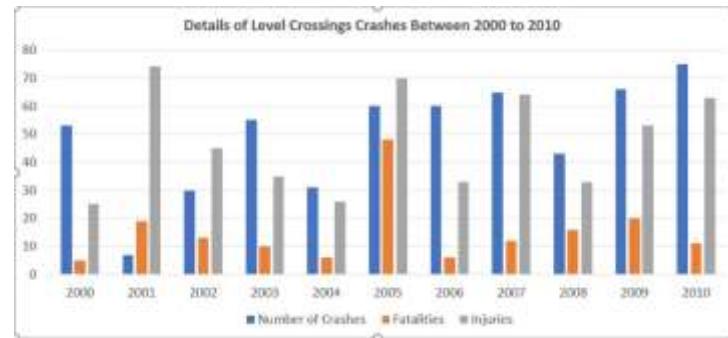

RESEARCH PROBLEM

Predict when to send the alert to the IOT device

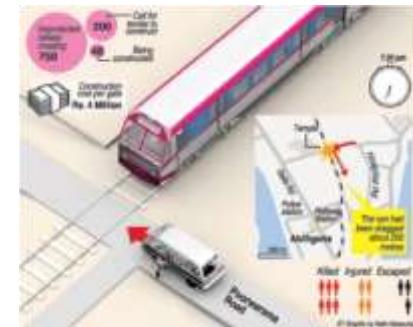

- So many railway-crossing collisions annually happen in Sri Lanka.
 - Lack of accurate and efficient to determine the impact of real-time alerts on passenger safety and satisfaction

[1]

12

[3]

OBJECTIVE

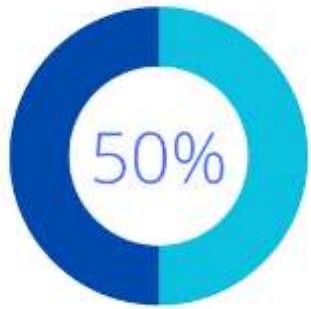

MAIN OBJECTIVE

- To develop a system that utilizes GSM trackers on trains and IoT devices at railway crossings to predict and alert potential blind spots on the train.

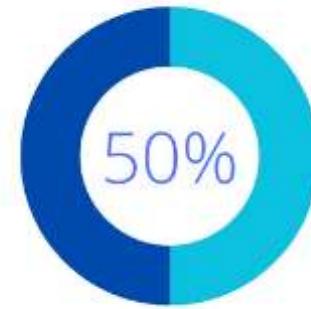

SUB OBJECTIVE

- To develop a GSM tracker that can transmit its location to the IoT device on the railway crossing.
- To enhance the safety measures at railway crossings by developing an IoT device that can detect approaching trains and send an alert to the nearby devices.
- To integrate the IoT device and GSM tracker to establish a communication link to send an alert when a train approaches the crossing. To investigate the feasibility and effectiveness of using manual training of datasets to predict the location of a lost GSM tracker signal in the railway industry.
- To evaluate the performance of the integrated system and its impact on improving the safety measures at railway crossings.

CURRENT PROCESS

Gather data from the tracking device

Send Distance for the IOT device on the crossing

EVIDENCE

The screenshot shows a Jupyter Notebook interface with the following code:

```
import numpy as np
from sklearn.linear_model import LinearRegression

# Let's create some example data.
# times are in seconds, and locations are in some coordinate system
times = np.array([1, 1, 2, 3, 4, 5]).reshape(-1, 1)
lats = np.array([1.1, 1.5, 2, 2.5, 3, 3.5]).reshape(-1, 1)
lons = np.array([1.1, 1.5, 1.8, 2.3, 2.7, 3.1]).reshape(-1, 1)

import pandas as pd

df = pd.read_csv("train_paths.csv")

df.head()

x=df['time']
```

In this screenshot, I imported the Linear Regression library and trained the data.

EVIDENCES

The screenshot shows a Jupyter Notebook interface with two code cells. The first cell contains code to create and train linear regression models for latitude and longitude based on time, and then predict the location at time + 10 seconds. The second cell uses the calculated models to predict the next location and then calculates the distance between the current and predicted locations.

```
# Create and train the models
lat_model = linearRegression().fit(times, lats)
lon_model = linearRegression().fit(times, lons)

# Let's predict the location at time + 10
time_to_predict = np.array([10]).reshape(-1, 1)
predicted_lat = lat_model.predict(time_to_predict)
predicted_lon = lon_model.predict(time_to_predict)

print('predicted latitude:', predicted_lat)
print('predicted longitude:', predicted_lon)

--> predicted latitude: [29.8625379]
predicted longitude: [6.5299964]

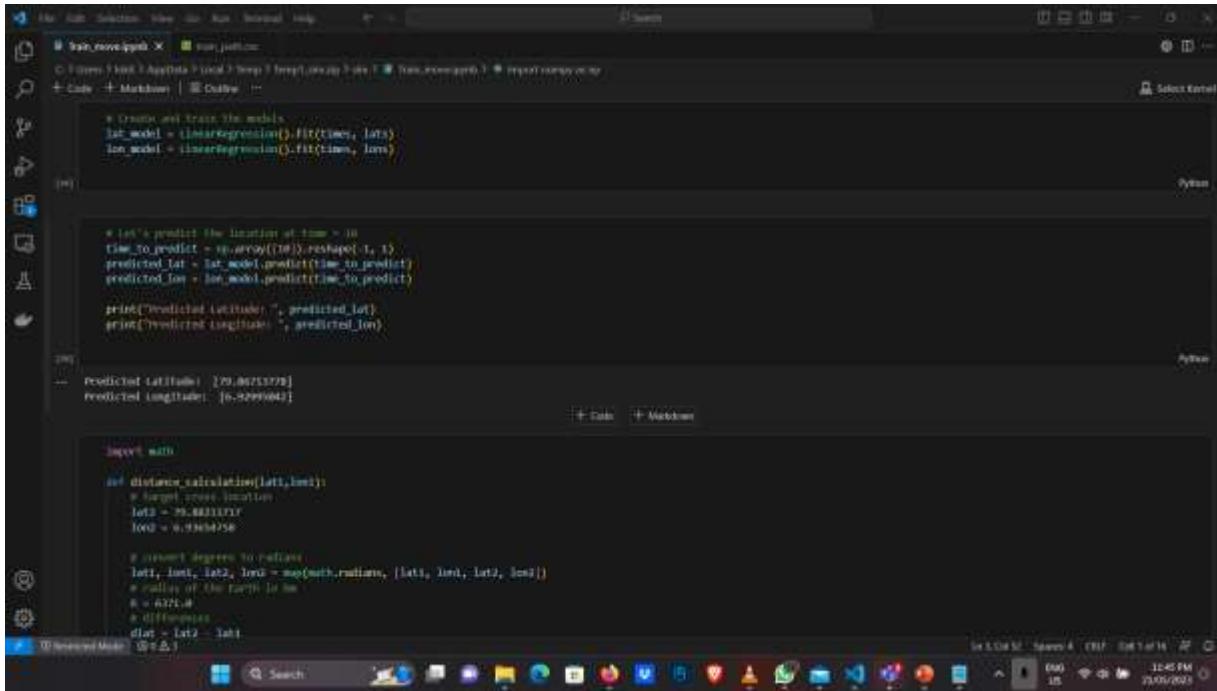

import math

def distance(lat1, lon1):
    # Target location
    lat2 = 29.8625379
    lon2 = 6.5299964

    # convert degrees to radians
    lat1, lon1, lat2, lon2 = map(math.radians, (lat1, lon1, lat2, lon2))
    # radius of the earth is 6371 km
    R = 6371.0
    # difference
    dlat = lat2 - lat1
    dlon = lon2 - lon1
    a = math.sin(dlat / 2) ** 2 + math.cos(lat1) * math.cos(lat2) * math.sin(dlon / 2) ** 2
    c = 2 * math.atan2(math.sqrt(a), math.sqrt(1 - a))
    d = R * c
    return d
```

In this step, I retrieve the longitude and latitude coordinates of the train and use a linear regression model to predict its location in the next 10 seconds

EVIDENCE

A screenshot of a Jupyter Notebook interface. The code cell contains the following Python script:

```
# Create and train the models
lat_model = linearRegression().fit(times, lats)
lon_model = linearRegression().fit(times, longs)

# Let's predict the location at time = 10
time_to_predict = np.array([10]).reshape(1, 1)
predicted_lat = lat_model.predict(time_to_predict)
predicted_lon = lon_model.predict(time_to_predict)

print('Predicted latitude: ', predicted_lat)
print('Predicted longitude: ', predicted_lon)

--> predicted latitude: [29.862527]
predicted longitude: [6.5299964]

import math

def distance_calculation(lat1,lon1):
    # Target location
    lat2 = 29.862527
    lon2 = 6.5299964

    # convert degrees to radians
    lat1, lon1, lat2, lon2 = np.radians([lat1, lon1, lat2, lon2])
    # radius of the earth is 6373.0
    R = 6373.0
    # difference
    dlat = lat2 - lat1
    dlon = lon2 - lon1
    a = np.sin(dlat / 2) ** 2 + np.cos(lat1) * np.cos(lat2) * np.sin(dlon / 2) ** 2
```

The distance calculations are displayed in this screenshot.

EVIDENCE

The screenshot shows a Jupyter Notebook interface with a dark theme. The code cell contains Python code for predicting train locations based on time stamps. The output cell displays the predicted latitude, longitude, and distance for five time stamps.

```
# Input times for which we want to predict location
times_to_predict = np.array([5, 10, 15, 20, 25, 30, 35, 40, 45, 50]).reshape(-1, 1)

# Predict the future locations
predicted_lat = lat_model.predict(times_to_predict)
predicted_lon = lon_model.predict(times_to_predict)

# Print out the results
for i in range(len(times_to_predict)):
    print("Predicted Latitude at time {} : {} ".format(times_to_predict[i][0], predicted_lat[i]))
    print("Predicted Longitude at time {} : {} ".format(times_to_predict[i][0], predicted_lon[i]))
    print("Distance : {} ".format(distance_calculation(predicted_lat[i], predicted_lon[i])))

Predicted Latitude at time 5: 79.48520554639454
Predicted Longitude at time 5: 6.929257168498
Distance : 1.879455682357586

Predicted Latitude at time 10: 79.4871377889801
Predicted Longitude at time 10: 6.9299944237862
Distance : 1.49617412538604

Predicted Latitude at time 15: 79.489010612947
Predicted Longitude at time 15: 6.930775867381048
Distance : 1.881880803386139

Predicted Latitude at time 20: 79.49080452733228
Predicted Longitude at time 20: 6.931590732257755
Distance : 1.252951598877496

Predicted Latitude at time 25: 79.49255853368855
Predicted Longitude at time 25: 6.932304525148882
Distance : 1.844154033869383
```

This screenshot displays the predicted location of the train at future time stamps.

EVIDENCE

The screenshot shows a Jupyter Notebook interface with a Python script named 'BikeCross.ipynb'. The code calculates the distance between two locations using the Haversine formula.

```
import math

# current location
lat1 = 5.889555555555555
lon1 = 100.50000000000001

# target location
lat2 = 6.095555555555555
lon2 = 100.49555555555556

# convert degrees to radians
lat1, lon1, lat2, lon2 = map(math.radians, [lat1, lon1, lat2, lon2])

# radius of the earth in km
R = 6371.0

# differences
dlat = lat2 - lat1
dlon = lon2 - lon1

# haversine formula
a = math.sin(dlat/2)**2 + math.cos(lat1) * math.cos(lat2) * math.sin(dlon/2)**2
c = 2 * math.atan2(math.sqrt(a), math.sqrt(1 - a))
distance = R * c
```

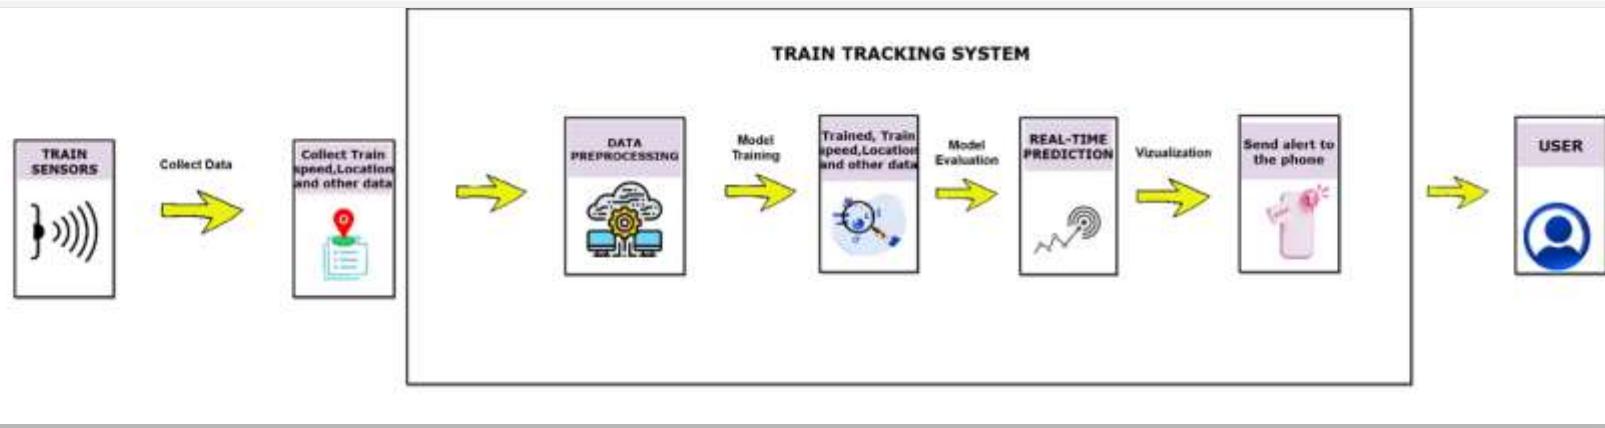

In this step, the difference between the crossing and real-time train location is calculated and the distance difference between these locations is predicted.

TASKS TO BE COMPLETED

When tracking signals lost on the blind spots Predict and send the necessary data to the IOT device on crossing.

To Develop the tracking device and Create Alerting system on the time stamps.

Sending alerts to the users via the app & Predicting the likelihood of crossing the railway- crossing

Jayanga B.M.C
IT20188672
Data Science

BACKGROUND

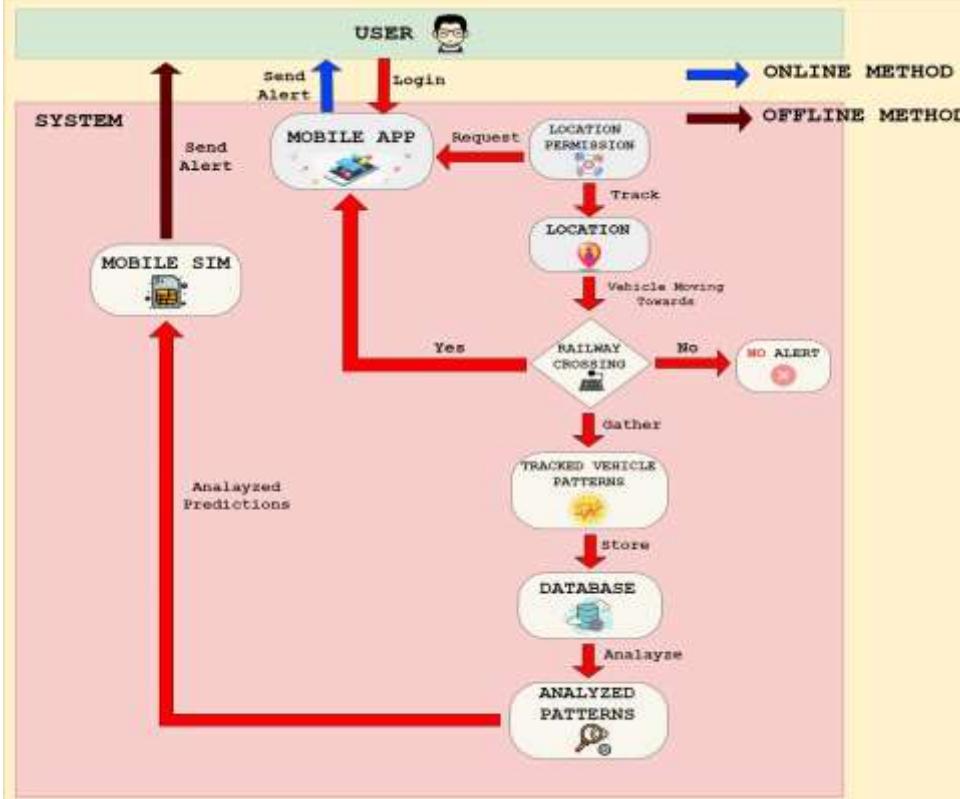

ANALYZE THE PAST PATTERNS OF VEHICLES AND PREDICT IF THEY ARE LIKELY TO CROSS THE RAILWAY CROSSING ON A GIVEN DAY

- Main Objective.
- Below objective should be completed first.
- If the app user crosses the railway crossing, the data will be collected to do the predictions.
- Data will be sent to the cloud-based database.

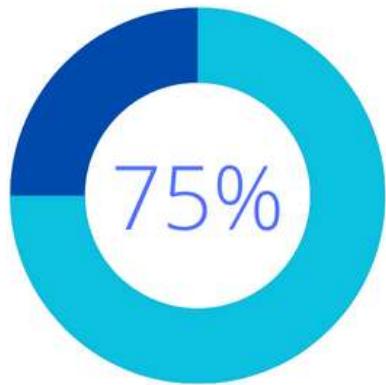

IDENTIFY THE VEHICLES THAT ARE MOVING TOWARDS THE RAILWAY CROSSING, AND SEND ALERTS ONLY TO THEM THROUGH THE APP.

- Secondary Objective.
- Ask the location permission from the user through the app.
- If only the user is moving towards the railway crossing, alert messages are sent.
- Otherwise, alert messages are not sent.

```

In this screen shot, the coordinates of the IoT device near the railway crossing is given.

And also, range circle points are also printed below in the screenshot.

EVIDENCE

In this screenshot, 2 range circles are shown centered on the IoT device at the railroad crossing.

EVIDENCE

```
from geopy import Point, distance

def is_user_within_range(user_location, center, radius_km=2):
    return distance.distance(center, user_location).km <= radius_km

# This is your starting point
start = Point(6.92995642, 79.86713778)

# Sample user locations
user_locations = [
    Point(6.914829, 79.878967),
    Point(6.914586, 79.878014),
    Point(6.915372, 79.876910),
    Point(6.915372, 79.876910),
    Point(6.916285, 79.876078),
    # Add more points here
]

# Check if each user is within the 2km range
for user_location in user_locations:
    if is_user_within_range(user_location, start):
        print(f"User at {user_location} is now in 2km range")
    else:
        print(f"User at {user_location} is outside the 2km range")

...
User at 6 54m 50.5044s N, 79 52m 44.2812s E is outside the 2km range
User at 6 54m 52.5096s N, 79 52m 40.8504s E is outside the 2km range
User at 6 54m 55.3392s N, 79 52m 36.876s E is now in 2km range
User at 6 54m 55.3392s N, 79 52m 36.876s E is now in 2km range
User at 6 54m 58.626s N, 79 52m 33.8888s E is now in 2km range
```

In this screenshot, shows whether the app user is in the range or outside the range.

EVIDENCE

```
def group_insert_point, distance
def is_user_passing_road(user_location, roads, proximity_radius, end=2)
# User location
# Roads

Cyber Security

RESEARCH GAP

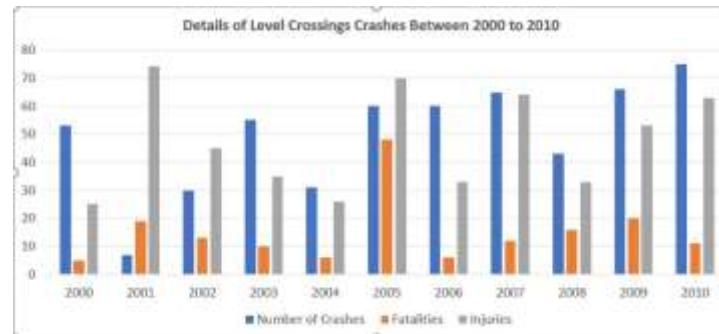

Security analysis for Train Tracking System

- Wireless Communication Security: Train tracking systems rely heavily on wireless communication to transmit data between trains and control centers. However, wireless communication is vulnerable to interception and interference. Research could focus on identifying the security risks associated with wireless communication in train tracking systems and developing effective security measures to address these risks.
- Privacy and security: Mobile applications for railway detection and tracking may gather private data regarding train routes, stops, and freight. To create safe and private applications that safeguard user information and guarantee the security and safety of railway operations, research is required.

RESEARCH PROBLEM

Security analysis for Train Tracking System

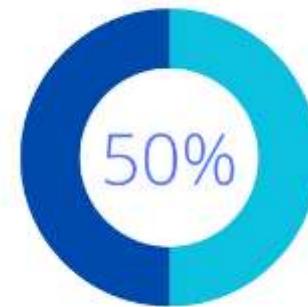

- There are many problems which occur in railways as there are no proper system implemented for the railways in Sri Lanka.
- Above statistics show the no of crashes are increasing year by year in railway crossings.
- There's no proper solution for these crashes, so implementation of a mobile application which have a connection with the railway crossing is the proposed solution for this problem.

                // break out of the inner loop  
                break;  
            }  
        }  
    }  
}
```

Catch the encrypted data and decrypt on this device.

This output one converts latitude and longitude numbers. It is a frequent one.

It is set to transfer when a message is sent.

```
19:00:07.961 -> Assigned numbers: 33,40,45,43,42,36,49,30,32,83,60,52,85,52,52,73,33,35,36,42,36,49,30,32,83,58,61,85,53,52  
19:00:07.961 -> Reversed string: longitude:95.55-latitude:40.25  
19:00:08.981 -> Assigned numbers: 33,40,45,43,42,36,49,30,32,83,60,52,85,52,52,73,33,35,36,42,36,49,30,32,83,58,61,85,53,52  
19:00:08.981 -> Reversed string: longitude:95.55-latitude:40.25  
19:00:09.974 -> Assigned numbers: 33,40,45,43,42,36,49,30,32,83,60,52,85,52,52,73,33,35,36,42,36,49,30,32,83,58,61,85,53,52  
19:00:09.974 -> Reversed string: longitude:95.55-latitude:40.25
```

OBJECTIVE

MAIN OBJECTIVE

- To develop a system to provide the security for the mobile application.

SUB OBJECTIVE

- Gathering data required for the implementation of the mobile security. This component need dataset such as general mobile threats and problems occur due to lack of security in mobile applications..
- Using of tools for ensure the safety of the mobile application such as penetration testing tools.
- The mobile application is using personal information as the user needs to be a registered user. An encryption is used to secure the password and the safety of the user data safety should be ensured within the mobile application.

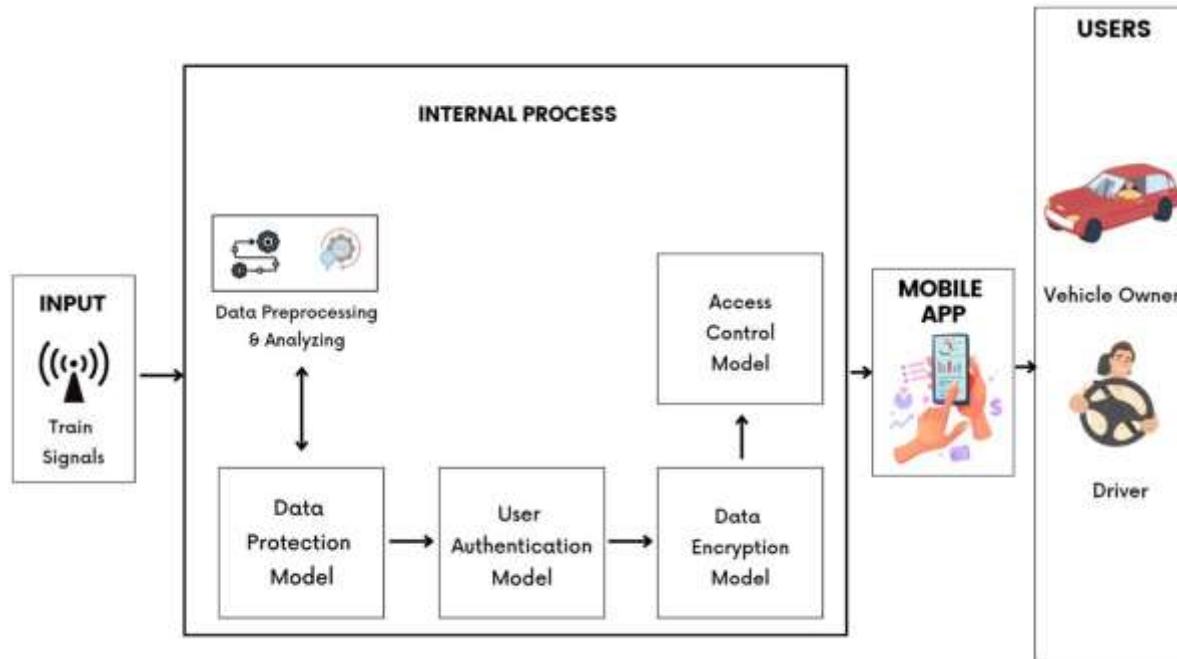

TASK TO BE COMPLETED

secure the otp come from mobile application otp.

A physical security can be placed on the physical device.

physical secure the device and also when using internet using https.

SYSTEM OVERVIEW

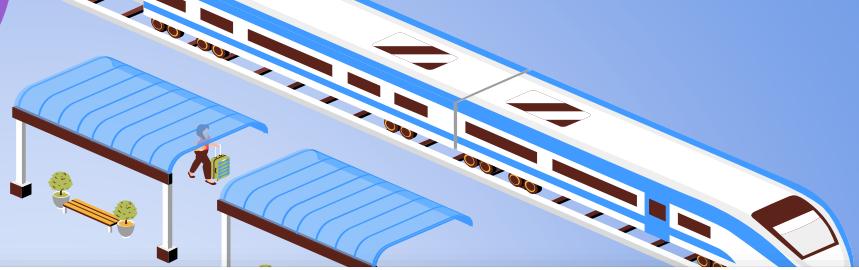

TOOLS AND TECHNOLOGIES

FRONTEND	FLUTTER
BACKEND	PYTHON
DATABASE	FIREBASE

Alerting system from IOT Device to SIM

Wijewardene L.L
IT20101824
Information Technology

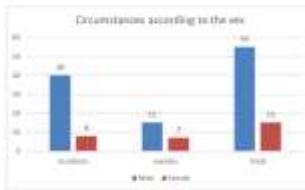

RESEARCH PROBLEM

Sending the flooded messages from the IOT device for the SIM users who are within a 1.5km radius

- So many collisions because of lack of real-time flooding alerting systems near railway crossings.

The following figure illustrates the different circumstances of death.

Sixty nine percent ($n=48$) were accidental while the rest were suicidal. Homicidal deaths or post mortem disposal was not observed. Accident was the foremost apparent manner of death among males 73% ($n=48$) (Figure 1).

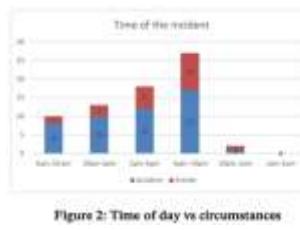

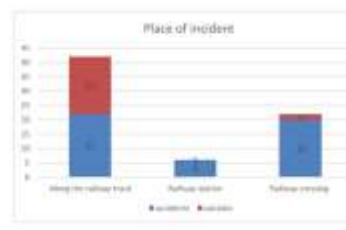

Figure 2: Time of day vs circumstances

The highest number of fatalities 64% ($n=45$) were observed between 2 pm to 10 pm. Sixty three percent ($n=30$) of accidents occurred during day light (6 am to 6 pm) whilst suicides showed a higher frequency 77% ($n=17$) in the evening and night. This was statistically significant (Figure 2).

The place of incident included railway station (and surrounding), rail track away from station, protected/ unprotected level crossings or close to the level crossing. (Figure 3) Rail track, railway station or the rail crossings are not safe for the users showing 22 (45.8%), 6 (12.5%) and 20 (41.7%) accidental fatalities respectively in these locations.

Figure 1: Circumstances of death

Of the 230 deaths and 477 cases of injury from 1,456 train accidents in 2018, 212 fatalities were classified as suicides or due to trespass on tracks. The vast majority of victims (167) were male. In 2018, level crossing accidents have caused 13 deaths and 69 cases of injury. Five people lost their lives falling off trains. In 2019, there were 215 deaths and 369 injuries coming from 1,385 train accidents. All but 15 of the deaths were classified as suicides/trespass on tracks. A further 10 deaths came from level crossing accidents, and five more from 76 cases of people falling off trains.

OBJECTIVE

MAIN OBJECTIVE

- Sending the flooded messages from the IOT device for the SIM users who are within a 1.5km radius

SUB OBJECTIVE

- Gathering the data from the IOT Device
- Provide the accurate real-time alert for the user within the specific radius.
- Flooding the alert among the users through the SIM.
- Make the flooding alert fast as possible among all the user's within the radius.

EVIDENCE

```
10 FirebaseData firebaseData;
11 FirebaseESP8266 firebase(FIREBASE_ESP8266HTTP_CLIENT);
12
13 RTC_DS3231 rtc;
14 SoftwareSerial sim800l(7, 8); // RX, TX
15
16 void setup() {
17   Wire.begin();
18   sim800l.begin(9600);
19   delay(3000); // Let the module self-initialize
20
21   if (!rtc.begin()) {
22     sim800l.println("Couldn't find RTC");
23     while (1);
24   }
25
26   if (rtc.lostPower()) {
27     sim800l.println("RTC lost power, let's set the time!");
28     rtc.adjust(DateTime(F(__DATE__), F(__TIME__)));
29   }
30
31   firebase.begin(FIREBASE_HOST, FIREBASE_AUTH); // connect to Firebase
32
33 }
```

In this screen shot, establish a connection with Firebase, retrieve data from the RTC module,

EVIDENCE

```
34 void loop() {  
35     DateTime now = rtc.now();  
36  
37     if (Firebase.getJSON(firebaseData, "/")) { // get all the users from Firebase  
38         for (JsonPair keyValue : firebaseData.getJSONObject()) { // loop over all users  
39             const char* key = keyValue.key().c_str();  
40             JsonObject& value = keyValue.value().as<JsonObject>();  
41  
42             const char* number = value["number"];  
43             const char* time = value["time"];  
44  
45             // Here you need to make sure the format of your time string from Firebase matches the one from your RTC  
46             // if they don't match, you'll need to parse/convert them to a common format for comparison  
47             String now_time = String(now.hour()) + ":" + String(now.minute());  
48  
49             if (now_time == time) { // if the current time matches the time from Firebase  
50                 sendSMS(number, "Careful"); // send the SMS  
51             }  
52         }  
53     }  
54 }
```

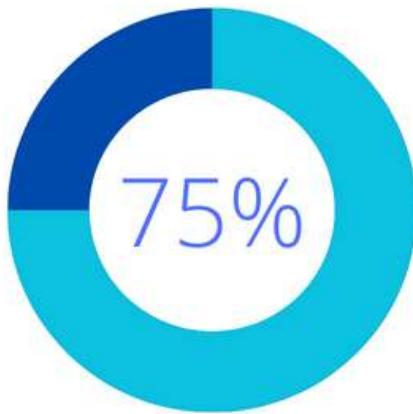

In this screen shot, get all the gathered users from the database firebase and also setting up the variables number and time.

EVIDENCE

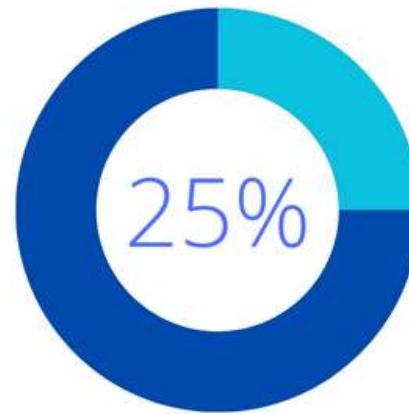

```
55  
56 void sendSMS(const char* number, const char* message) {  
57     sim800l.println("AT+CMGF=1"); // Set the SMS mode to text  
58     delay(1000);  
59     sim800l.print("AT+CMGS=\\"");  
60     sim800l.print(number);  
61     sim800l.println("\\"");  
62     delay(1000);  
63     sim800l.print(message);  
64     sim800l.println((char)26);  
65     delay(1000);
```

In this screen shot,
setting up the initial
SMS sending mode

CURRENT PROCESS

Gathering the data from the
IOT Device

Flooding the alert among the users
through the SIM.

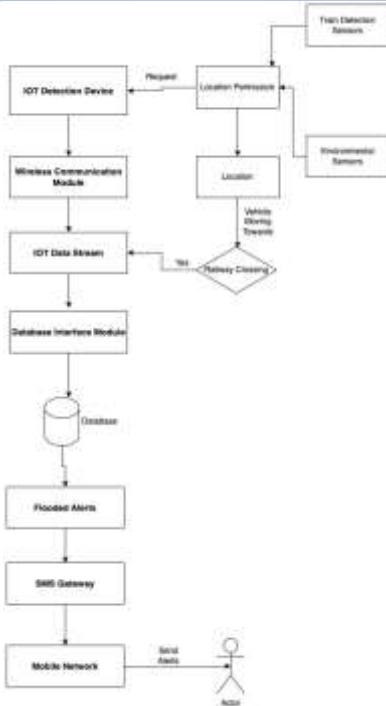

TASK TO BE COMPLETED

Integrated to the SIM 800I GSM model

Implementation of flooded message device

Implementation of the frontend for the mobile application
